# Topics

- Calibration/Validation: Kyle Hoegh
- Activity analysis and applications: Ken Maser
- Advanced Analysis: Shongtao Dai

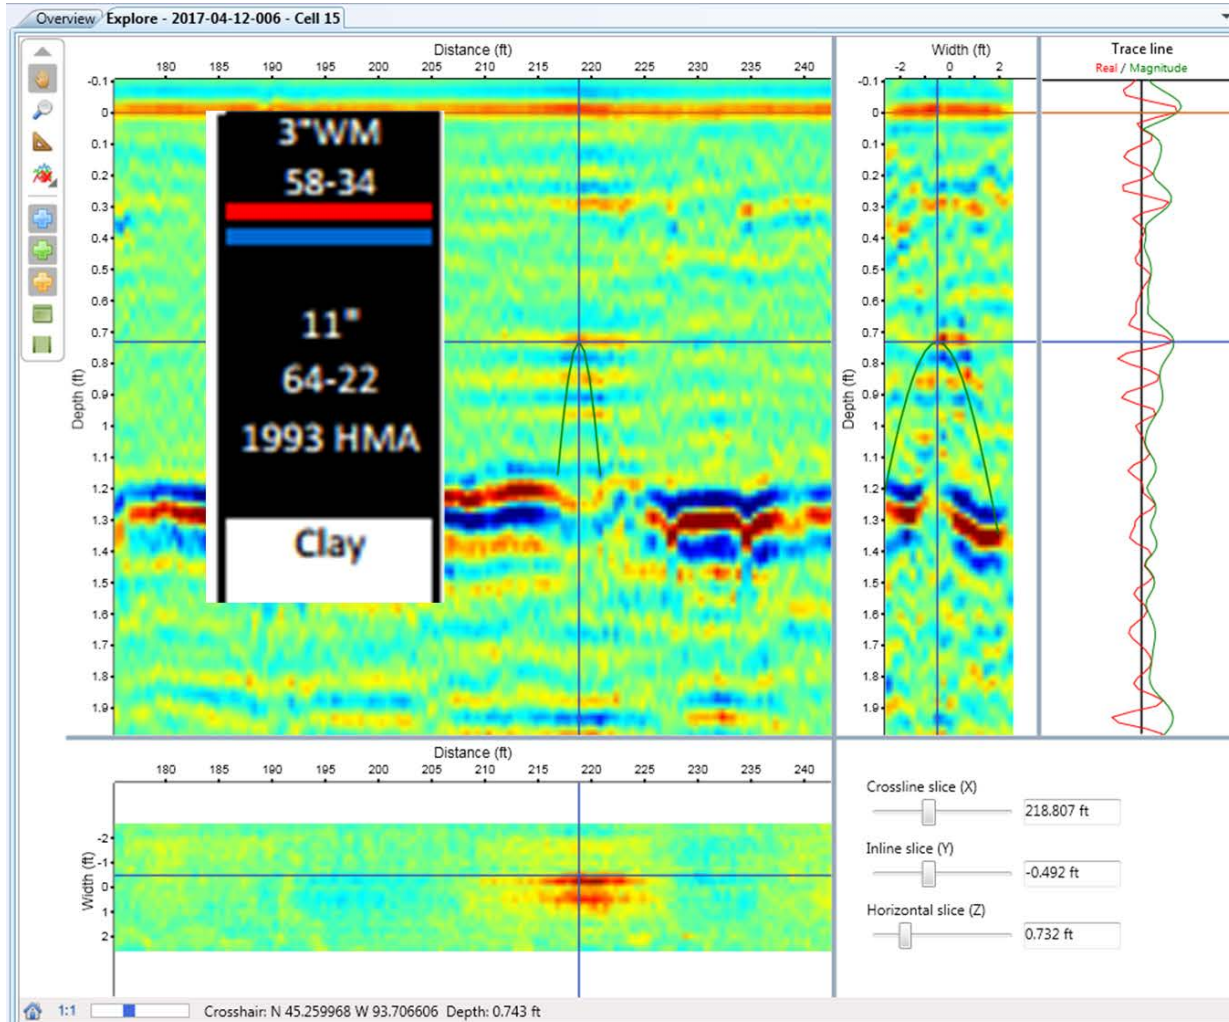

# Calibration/Validation Topics

- Highway Speed GPS accuracy (MnROAD)
- Controlled Laboratory Tests (Metal Plate and HDPE plastic)
  - Sampling Rate
  - Metal Calibration
  - Air Calibration

# Highway Speed GPS accuracy (MnROAD)

# GPS accuracy: Implications for Implementation

# Examiner Results: MnROAD

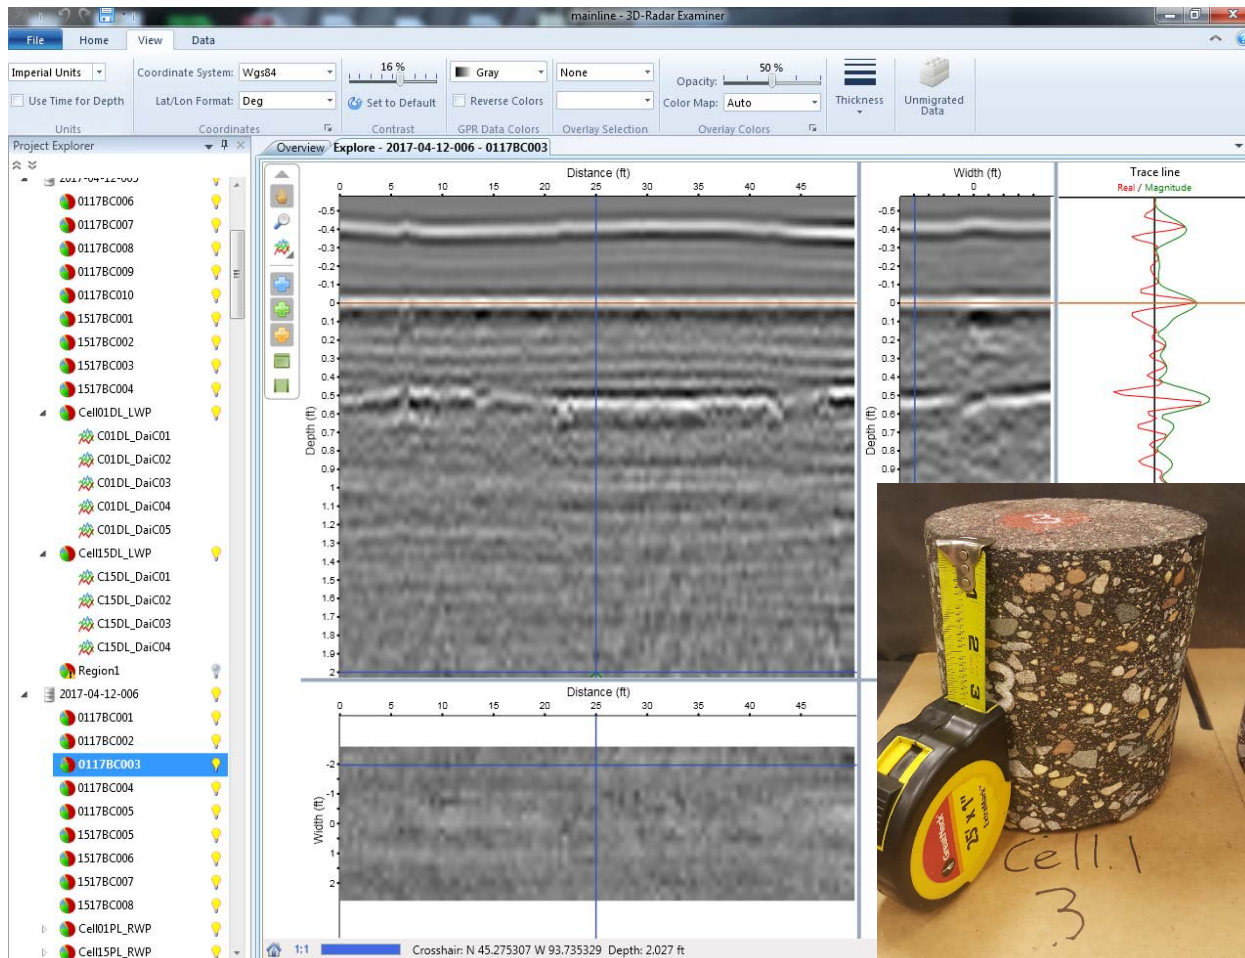

## Cell 1

Core ID	Core Condition	Qualitative GPR Signal Assessment
1	shallow slight deter/strip	direct shallow anomaly
2	insignificant	strong backwall
3	none/sound condition	strong backwall
4	lg crack/deterioration	backwall shadow
5	deterioration (coring caused?)	backwall shadow/slight direct
6	slight shallow/bottom deterioration	backwall shadow
7	shallow slight deter/delam	direct shallow anomaly
8	minimal middepth stripping	slight shadowing
9	slight deterioration/strip	direct reflection (deeper than distress)
10	shallow slight deter/delam	banding/shadowed backwall

# Examiner Results: MnROAD Sound Pavement, Clear Signal

Cell 1

Core ID	Core Condition	Qualitative GPR Signal Assessment
3	none/sound condition	strong backwall

# Examiner Results: MnROAD Deteriorated Pavement, Unclear

slight deterioration/strip

direct reflection (deeper than distress)

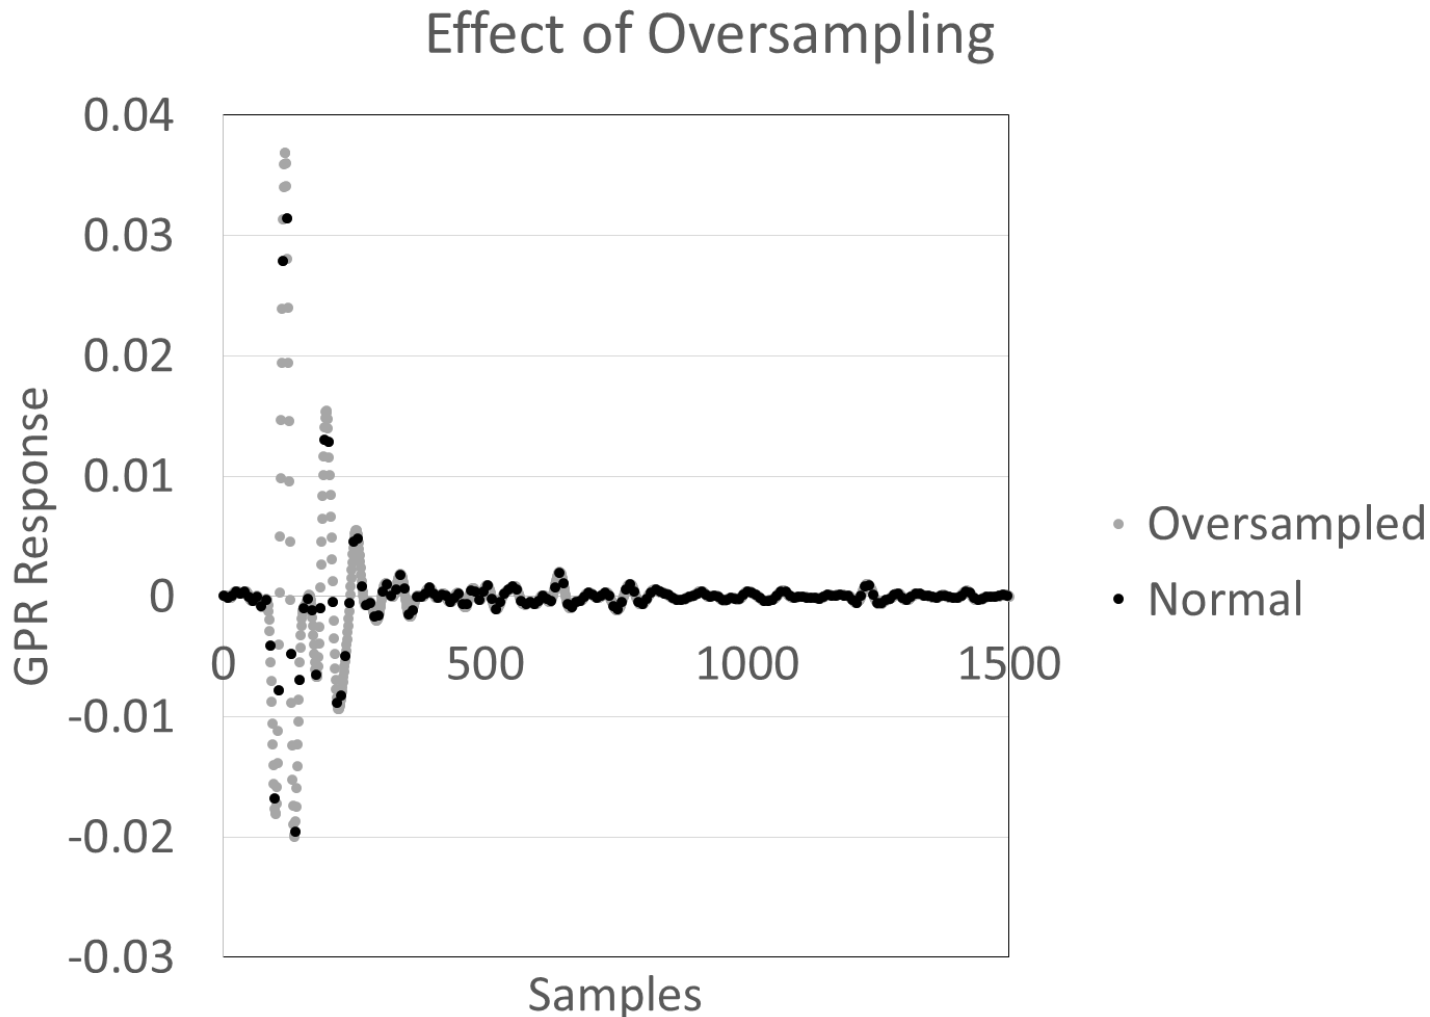

# Examiner Results: MnROAD

## Cell 15

Core ID	Core Condition	Qualitative GPR Signal Assessment
1	mid-depth strip/delam	slight anomaly/shaddowed backwall
2	clear stripping	direct anomaly
3	crumbled stripping	direct anomaly
4	slight strip/deterioration	slight anomaly/shaddowed backwall
5	no significant distress	strong backwall
6	clear stripping	direct anomaly
7	clear stripping	direct anomaly
8	slight deterioration	edge of anomaly

# Controlled Laboratory Tests: Sampling Rate

# Controlled Laboratory Tests: Sampling Rate

Effect of Oversampling - Zoom

# Controlled Laboratory Tests: Air Calibration

## Extract “Air Wave”

- Face antenna away from the surface
- Eliminate portion of the signal that is only affected by the antenna

# Controlled Laboratory Tests: Metal Calibration

4'x8' Metal Surface Reflection Amplitude

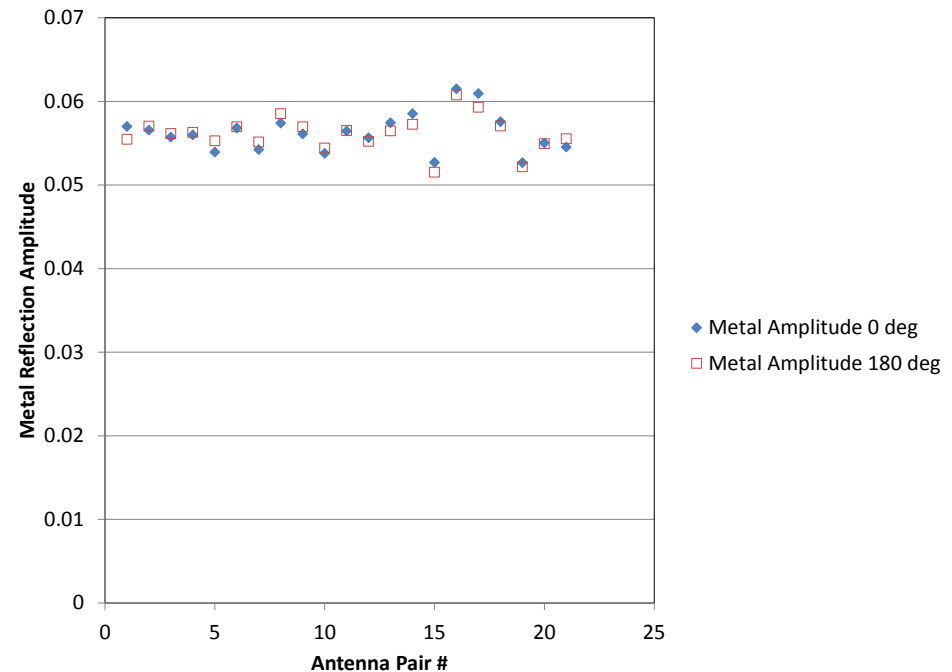

- Placed in the center of the antenna array
- Use the amplitude of the surface reflection to characterize the signal magnitude

# Controlled Laboratory Tests: Metal Calibration

4'x8' Metal Surface Reflection Amplitude  
– Placed in the center of the antenna array  
– Rotated 180 degrees and placed in the center of the antenna array

# Controlled Laboratory Tests: HDPE Plastic

## HDPE Surface Reflection Amplitude

- Plastic Sheet (HDPE) Calibration
- Manufacturer Dielectric Listed: 2.30
- Known Dielectric can be used to evaluate effectiveness of air, metal, and oversampling calibrations

$$\epsilon_{HMA} = \left( \frac{1 + \frac{A_0}{A_P}}{1 - \frac{A_0}{A_P}} \right)^2$$

# Controlled Laboratory Tests: HDPE Plastic Dielectric

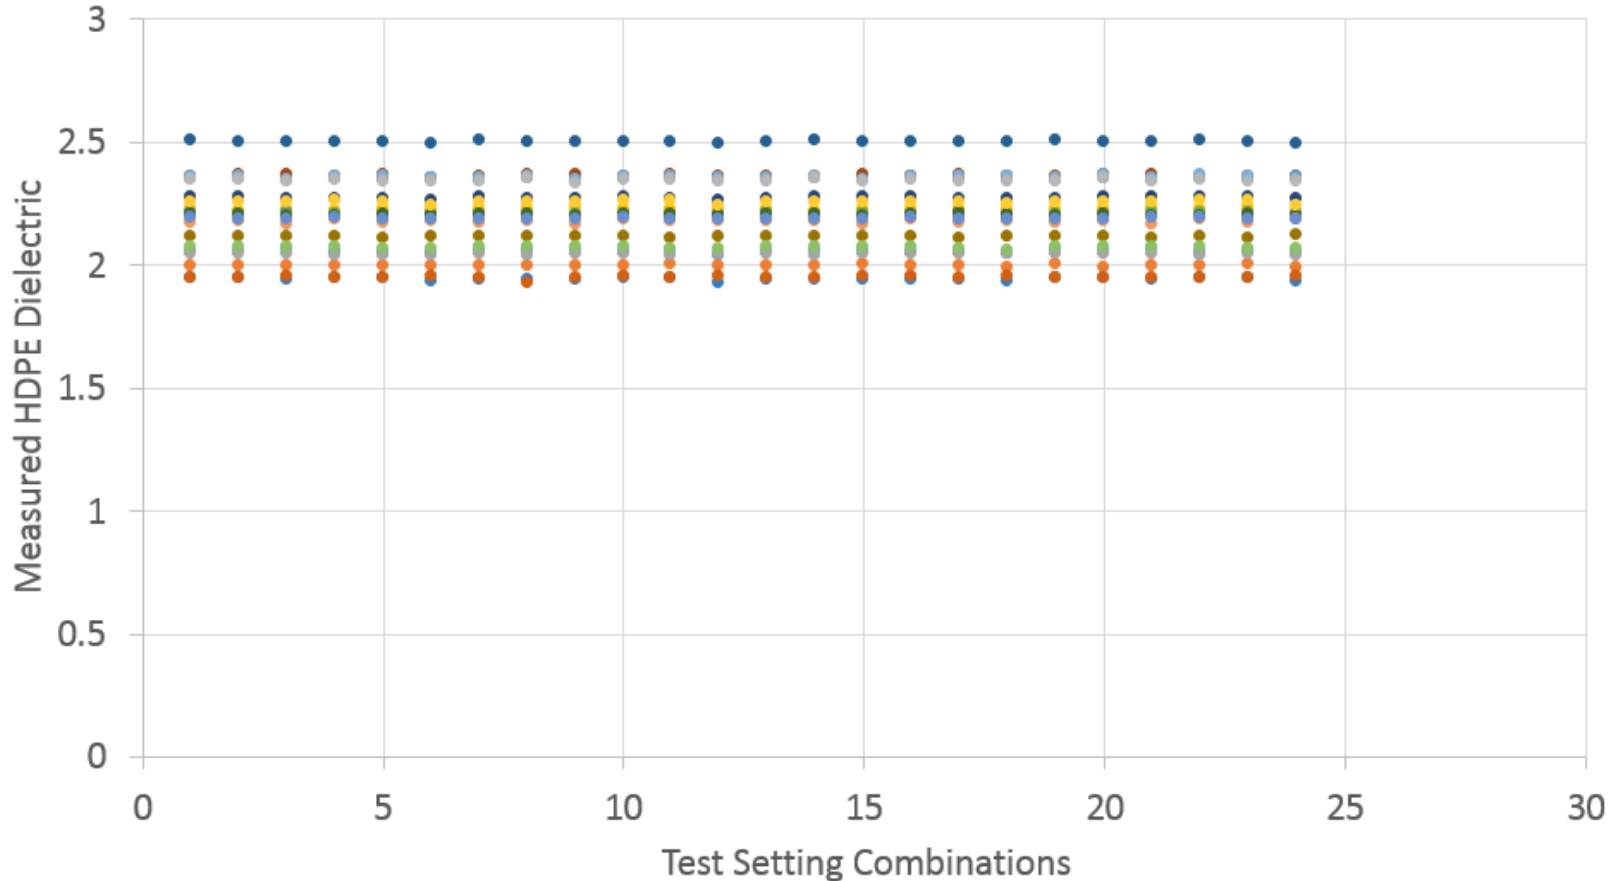

$$\epsilon_{HMA} = \left( \frac{1 + \frac{A_0}{A_P}}{1 - \frac{A_0}{A_P}} \right)^2$$

- PlasticDielectric\_Before Air Removal
- Plastic Dielectric After Air removal

# Controlled Laboratory Tests: HDPE Plastic Dielectric Test

# Controlled Laboratory Tests: HDPE Plastic Dielectric Test

# Calibration Result Implications

- 3D Radar equipment can integrate the GPS with the GPR data with high accuracy even at highway speed
  - Useful to integrate an external GPS connected to a virtual reference station or other correction method to get full potential of equipment
  - This allows for selection of validation cores fully based on GPS data
  - Improved accuracy and efficiency of selecting core validation locations
- Incorporation of oversampling, metal, and air calibration into analysis can improve 3D radar signal
  - 3D Radar is working on incorporating some of these calibration options, but none are currently available in examiner and require outside analysis.
  - Oversampling can improve digital representation of the true analogue signal which is important for amplitude calculations and filtering technique applications
  - Metal and air calibrations are critical to addressing antenna to antenna variation and reducing signal noise

# TH 7 in Clara City, Mn

- 16 mile section, 1 lane in each direction
- Pavement thickness ~ 10 inches
- Pavement has regular transverse cracking, spaced 10 – 30 feet
- 2 Cores were taken near each MP, one over a crack and one 2 feet away
- Many cores showed evidence of stripping
- 3D Radar data was collected – Dec. 2016 and May 2017
  - Dec 2016 – many short files directly over the cores
  - May 2017 – long files covering multiple core areas

# Conclusions

- Activity analysis reasonably quantifies locations of moisture damage and stripping
- Can be applied to long segments of pavement
- Threshold is arbitrary – core correlation is needed to set the threshold
- Core condition has been visual and qualitative – could benefit from quantitative testing such as indirect tensile testing..

NCAT

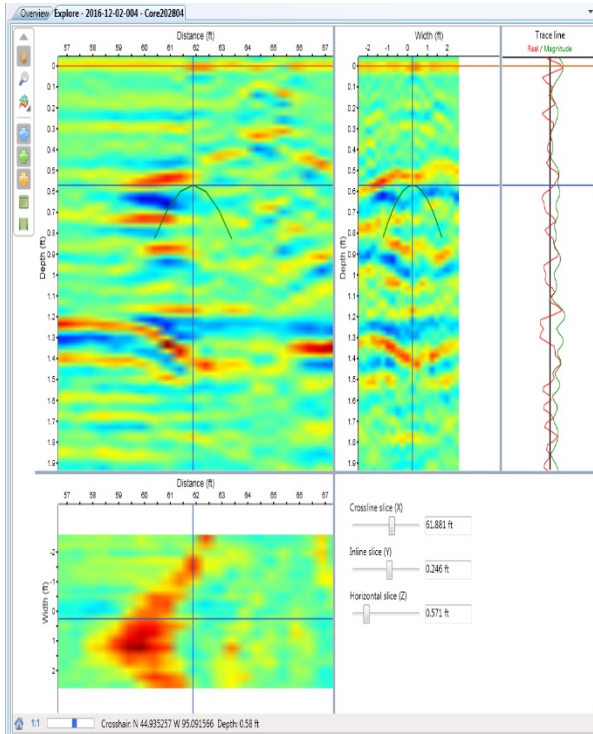

MnDOT District Offices

# Concept of Signal Analysis

- GPR image consists of a lot of time-history waveforms
- Each waveform contains some information about the pavement
- A Perfect (homogenous and uniform) Layered System

# A Layered System with Defect (Stripping)

## ■ Real Signal Contains Noise

- ◆ Noise makes "disturbed" waveform less visible

# Purpose:

**Evaluate different signal analysis methods to minimize noise and enhance “disturbed” signal by defect.**

**Eventually use computer to automatically pick the potential defects.**

# Signal Analysis Methods from Acoustic Emission (AE)

- AE is used for detecting earthquake
- First arrival of P wave used to estimate hypocenter location

$$S_2 = \sigma^2 = \frac{\sum_{i=1}^N (Y_i - \bar{Y})^2}{N-1}$$

$$S_4 = \text{kurtosis} = \frac{\sum_{i=1}^N (Y_i - \bar{Y})^4}{(N-1)\sigma^4} - 3.$$

$$S_6 = \frac{\sum_{i=1}^N (Y_i - \bar{Y})^6}{(N-1)\sigma^6} - 15.$$

A first arrival identification system of AE Signals  
 T. Lokajicek and K Klima, Meas.Sci. Technol,2006

# Maximum Energy Ratio

- ◆ Energy before and after the first arrival in a small time window has a large difference

$$R_p = \frac{\sum_{i=p+1}^{p+M} Y_i^2}{\sum_{i=p-M}^{p-1} Y_i^2}$$

(Shah and Labuz, 1995)

# Analysis Results

# ExploreGPR: Activity Method (Dr. Ken Maser)

## ◆ Energy method in ExploreGPR

# Summary

- On-going effort
- Energy, S4 and S6 analysis approaches successful in identifying stripping at a controlled section at NCAT
- Need to be evaluated on multiple field projects where the stripping is more variable
- Goal: Use different methods to analyze signal. If all or most methods indicate a common area with “unusual” activity, the area is worth to be investigated further, could be “stripping”.
