

Rapid Technologies to Enhance Quality Control on Asphalt Pavements Infrared (IR) Scanner Workshop

Hosted by: Virginia DOT Eastern Federal Lands May 17, 2016

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

Workshop Objective

- 1. Describe the Infrared Scanner Technology (What is it and Why it is needed?)
- 2. Understand how to use the IR Equipment & Software
- 3. Discuss the results from the Virginia DOT and Eastern Federal Lands Demonstration Projects
- 4. Discuss the Contractor's and Agency's Perspective as a QC or QA Tool
- 5. Know Implementation Strategies

Infrared Scanner Workshop

AGENDA:

Time	Topic/Presentation
9:30 to 9:45	Welcome and Introductions
9:45 to 10:15	Introduction to Infrared Technology: What is it and Why is it Needed?
10:15 to 10:30	Equipment and Software: How to use it?
10:30 to 11:00	Data Analyses and Findings
11:00 to 11:30	Agency Perspective as a QA Tool
11:30 to 12:00	Contractor's Perspective as a QC Tool
12:00 to 1:15	Lunch (Catered for workshop)
1:15 to 2:00	 Implementation Strategies (focus on Agency use): 1. Products and Application of Products 2. Trouble Shooting Guide Lead Agency Strategies/Specifications
2:00 to 2:30	Questions/Answers and Closing Comments
2:30 to 2:35	IR Workshop Wrap-Up
2:35 to 3:00	Presentation and Demonstration of Ground Penetrating Radar Equipment

Infrared Technology (IR)

What is it and why use it?

May 17, 2016

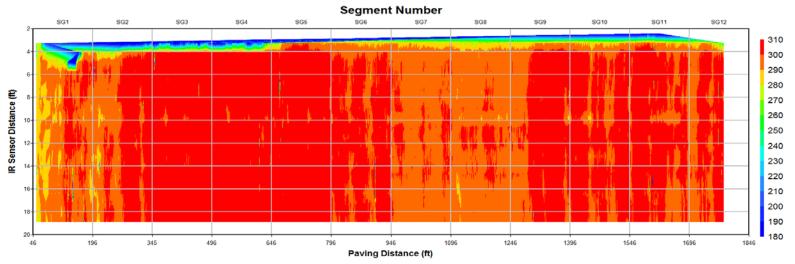

1. IR - Defined.

- 2. How is it measured?
- 3. Why is it important?

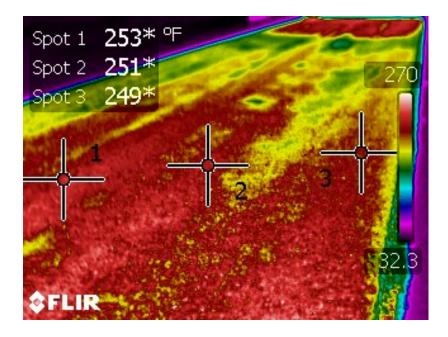

Infrared Thermography:

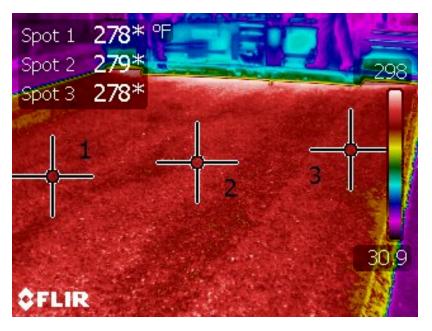

- The mapping of temperature contours (equal temperature) over the surface of a material.
- Contours are used to evaluate materials by measurement of their surface temperature and its variation.

Temperature segregation (differential):

 More than 25 °F difference in mat temperature behind screed.

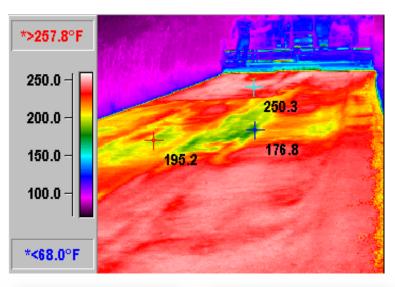

Types of Temperature Differences:

- 1. Cold spots
 - Truck to truck temperature differences
 - Improper loading and unloading of trucks
- 2. Thermal streaks
 - Longitudinal segregation
 - Inadequate or non-uniform amount of material across the mat

16/08/06 09:13:43 e=0.97

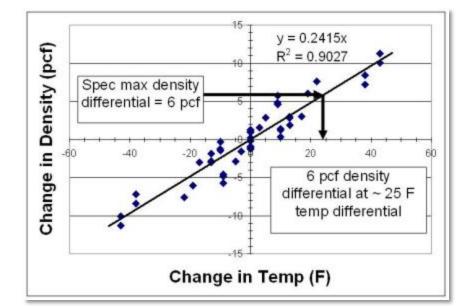

- Cold spots
 - Temperature difference of mat between truck exchanges – common.
 - Areas with higher air voids
- Focused testing have validated higher air voids
 - Coring
 - Radar (full coverage)
 - Nuclear gauge

Background

- 1996 through 2000s field work concluded temperature differences could be accurately detected and quantified:
 - Low temperatures result in low density zones in mat
 - A few States adopt temperature uniformity specification

Temperature profile criteria based on desired density uniformity.

- 1. IR Defined.
- 2. How is it measured?
- 3. Why is it important?

History; Mat Temperature Measurements

- Temperature guns
 - Point readings
- Temperature cameras
 - Time specific to identify areas with cold spots or thermal streaks

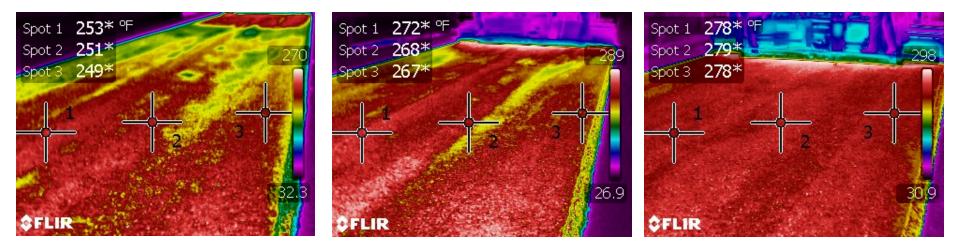

History; Mat Temperature Measurements

- IR sensors, IR-Bar; first device for continuous readings
- Pave-IR Scanner; second generation device for continuous readings

Application & use of temperature cameras

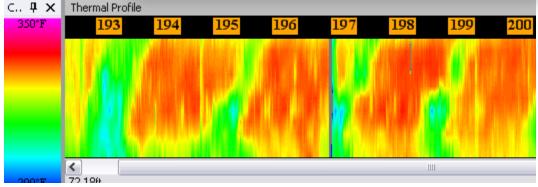

- Identify areas with cold spots for biased sampling in density specification
- Identify thermal streaks

Application & use of IR-Bar and Scanner

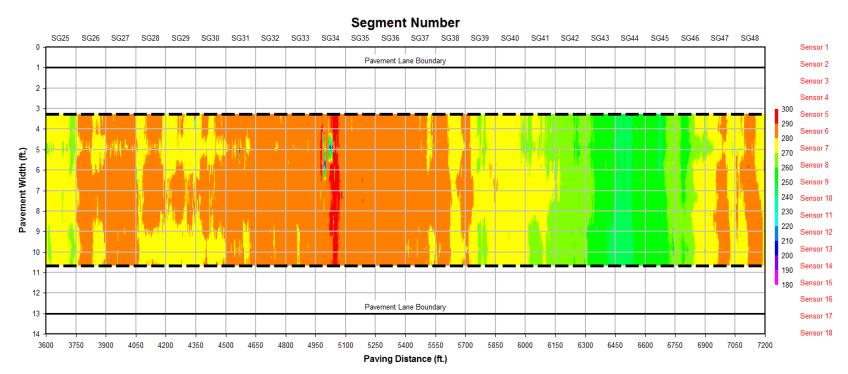

- Continuous readings to evaluate mat uniformity through temperature uniformity.
- Non-uniform temperatures usually mean, nonuniform densities.

- 1. IR Defined.
- 2. How is it measured?
- 3. Why is it important?

- Aggregate segregation in mat = temperature segregation
- Non-uniform temperatures usually result in non-uniform densities

Segregation – A difficult issue to resolve, when it is difficult to identify or confirm.

 Truck to truck segregation results in cold spots; IR can accurately identify these areas.

• Both sided longitudinal and centerline segregation result in thermal streaks; IR can identify these areas.

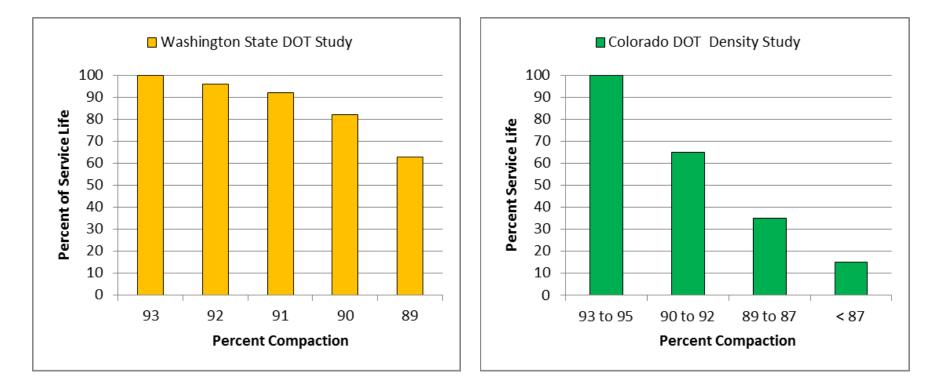

- Effect of cold spots, low mat temperatures on percent compaction; densities are:
 - Lower
 - More variable
- TTI Study: $\Delta 25 \ ^{\circ}F \sim \Delta 6 \ pcf$
- Maine DOT: $\Delta 20 \ ^{\circ}F \sim \Delta 4 \ pcf$

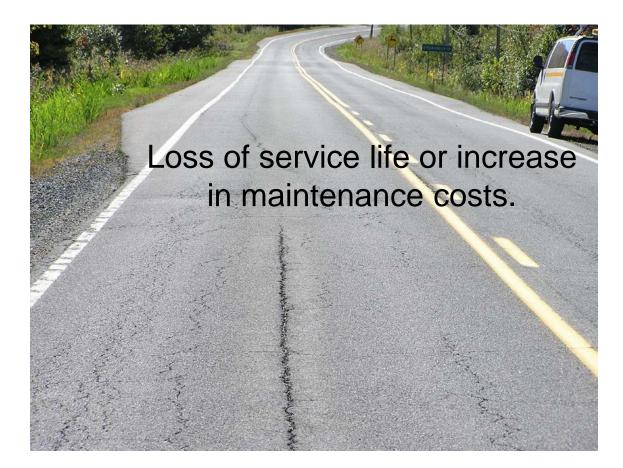

• Effect of reduced compaction because of lower mat temperatures or inadequate rolling.

Impact of temperature differences or areas with low temperatures.

Cold spots; areas with increased potential for:

- Fatigue cracks
- Raveling
- Pot holes

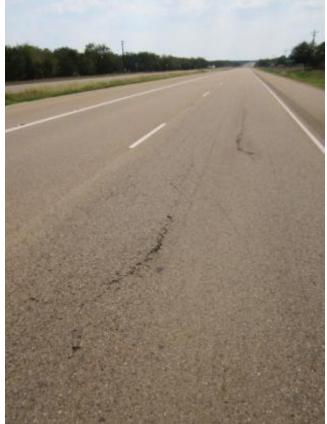

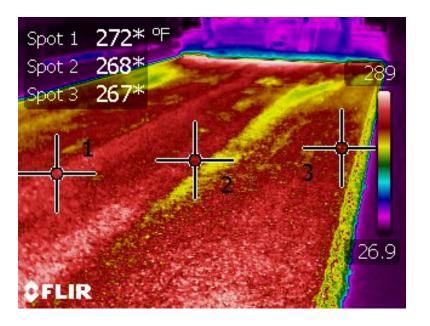

Thermal streaks; longitudinal areas with increased potential for:

Longitudinal cracking

- Thermal streaks can be very damaging, depending on the level of density achieved in localized areas.
- Measuring the density, accurately, in a localized area is complicated.

NEXT:

• Equipment and Software: How to use it?

Infrared Technology (IR)

IR Equipment and Software: How to Use It?

May 17, 2016

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

- 1. Equipment and Installation
- 2. Software and Its Features

Equipment

- Mast Base
- Mast Extension
- Mast Arm
- IR Scanner
- DMI
- GPS Unit
- Wiring
- Connection bolts & materials

IR mast base and extension attached to paver.

Mounted Directly to Screed

- IR Scanner attached to paver; scans mat behind screed in one direction.
- GPS attached to the mast arm.

IR scan screen used to see/monitor mat temperatures in real time; attached to the mast post or extension.

DMI placed on wheel hub to measure distance during paving operation.

- 1. Equipment and Installation
- 2. Software and Its Features

Two models of data transfer and extraction

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

- 1. Project Overview
- 2. Data Collection
- 3. Data Processing
- 4. Data Summary

US Route 15; Northbound and Southbound Lanes

Mixture placed with Caterpillar paver. MTV used on the US Route 15 project.

Mixture delivered to site with end dump discharge trucks.

Mixture placed with Blaw-Knox paver; no MTV used.

Compaction Train; all steel wheel rollers used on both projects.

Rollers on US 1

Rollers on US 15

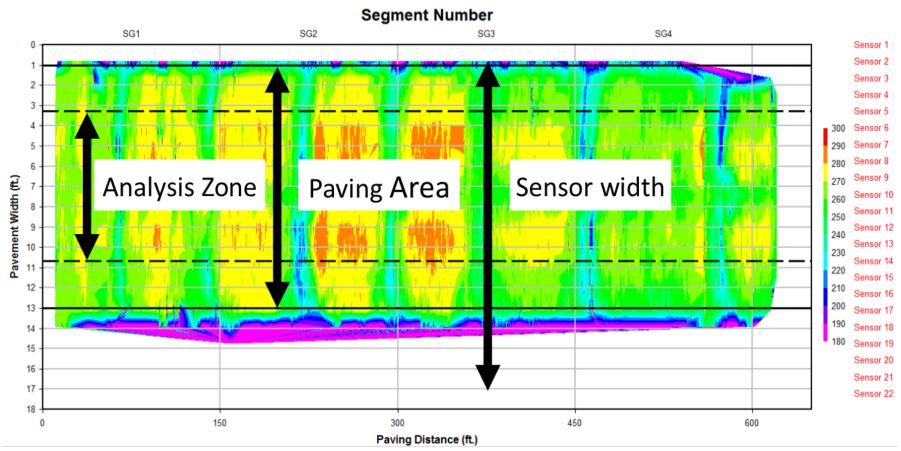

Nuclear & non-nuclear density gauge used to measure mat density and superimposed on temperature profiles.

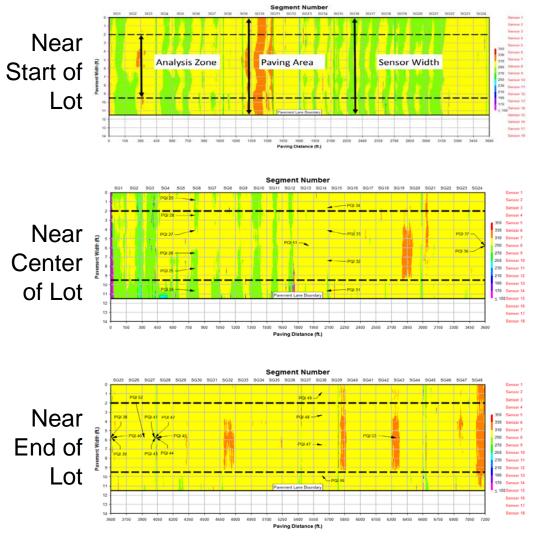

- 1. Project Overview
- 2. Data Collection
- 3. Data Processing
- 4. Data Summary

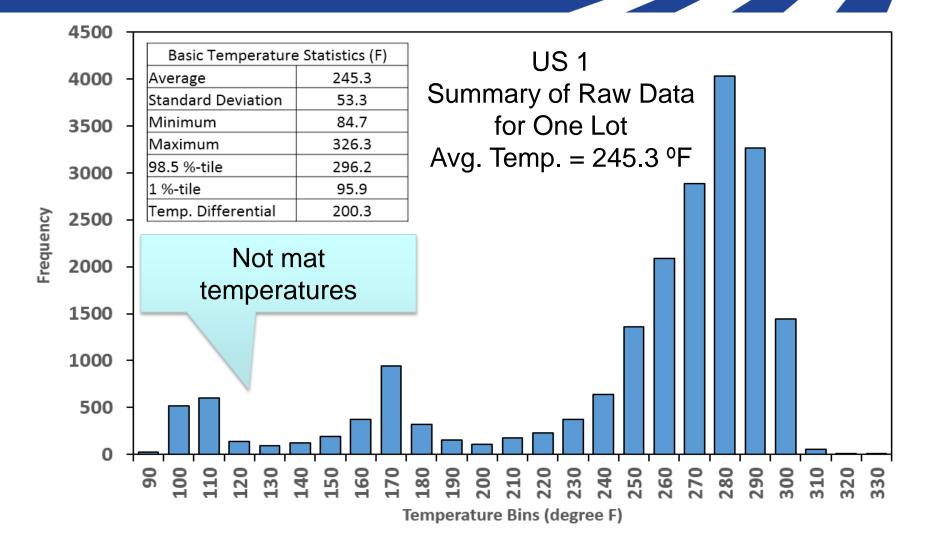

Raw Temperature Profile for first part of the first lot.

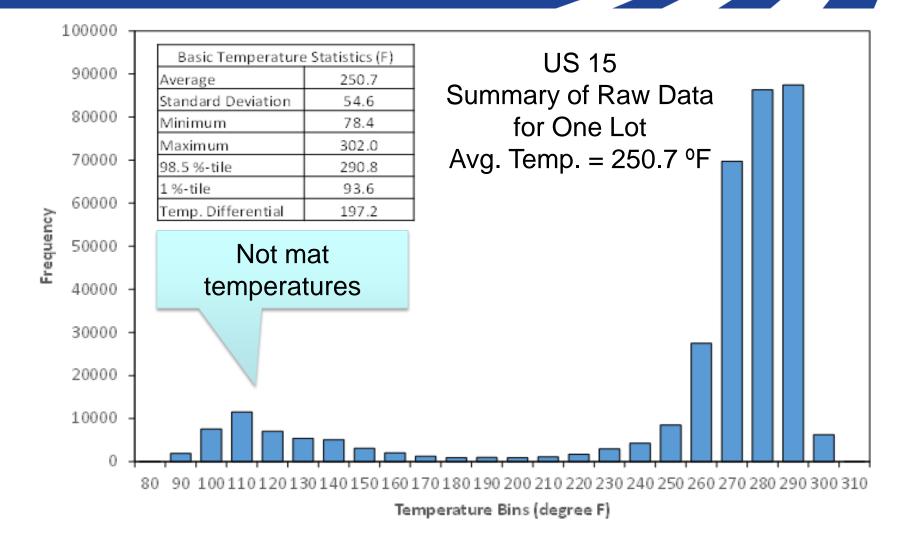

Raw Temperature Profile showing continuous improvement or more uniform mat temperatures as paving progresses.

Example from Maine demonstration project.

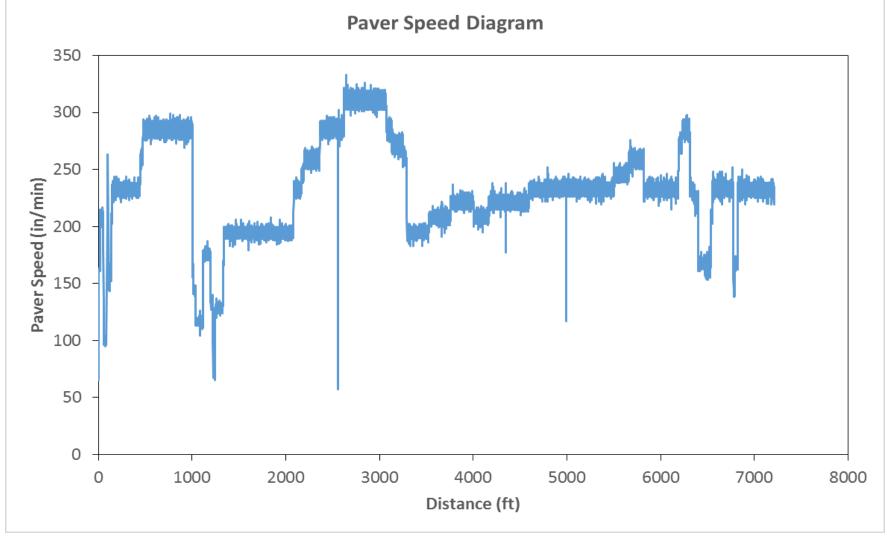

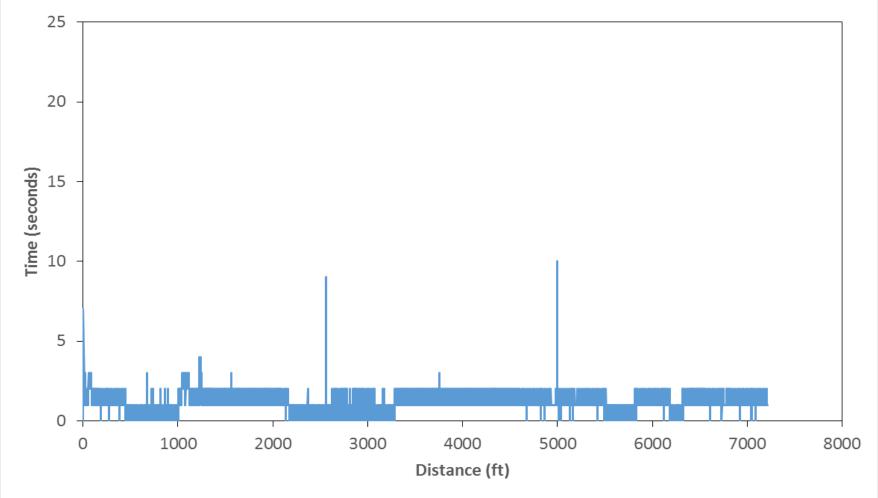

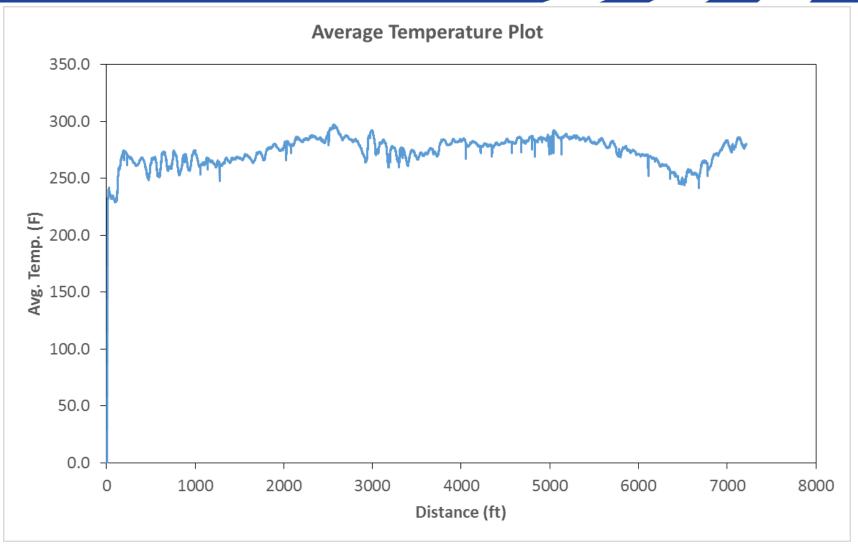

Data diagrams reviewed during production:

- 1. Paver speed diagram
- 2. Time plot
- 3. Average temperature plot

Time Plot

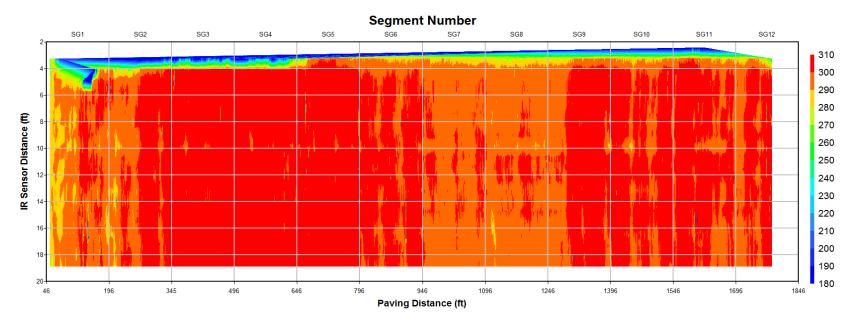

- 1. Project Overview
- 2. Data Collection
- 3. Data Processing
- 4. Data Summary

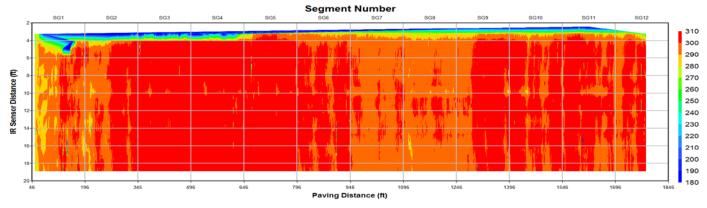

Data Processing—eliminate invalid temperature measurements:

1. Eliminate measurement locations within 2 feet of the mat's edge.

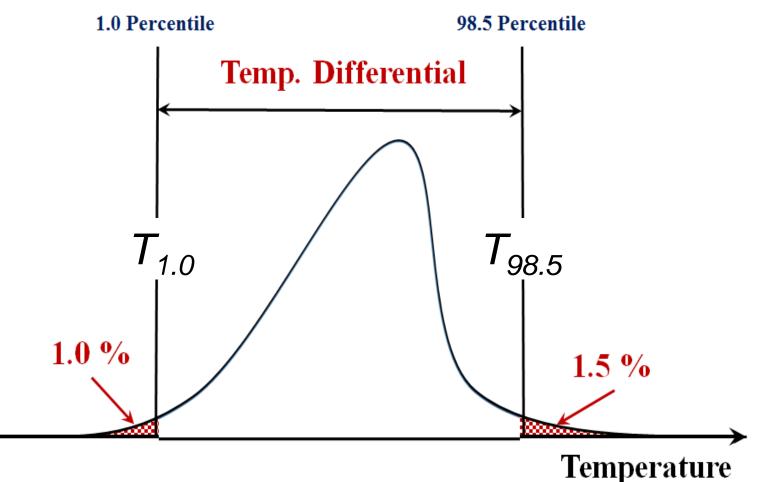

Data Processing—eliminate invalid temperature measurements:

- 2. Eliminate data with paver stops greater than 10 seconds, between locations:
 - 2 feet behind measurement location of stop
 - 8 feet in front of measurement location of stop
- 3. Eliminate temperature readings < 170 $^{\circ}$ F and > 400 $^{\circ}$ F.

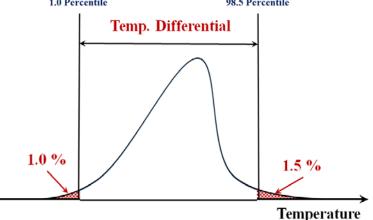

• Temperature Differential, each 150 foot segment

Temperature Differential Criteria, each 150 foot segment:

$$T_{Diff} = T_{98.5} - T_{1.0}$$

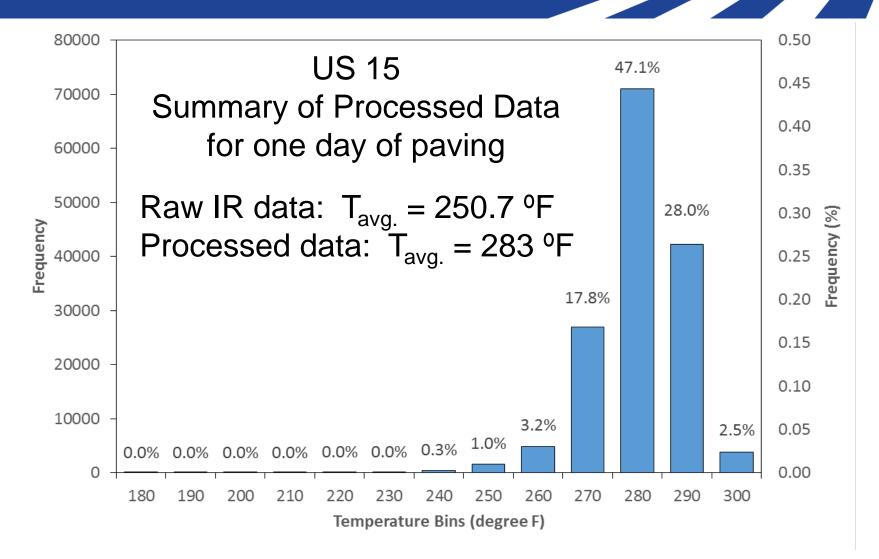

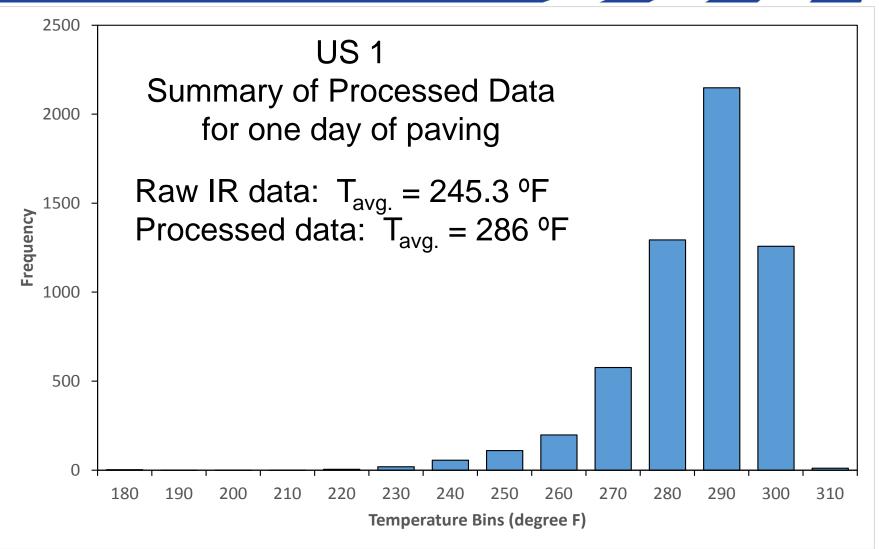

- $T_{diff} \le 25 \ ^{o}F$
- $25 \,{}^{\circ}\text{F} < \text{T}_{\text{diff}} \le 50 \,{}^{\circ}\text{F}$
- T_{diff} > 50 °F

No temperature difference

Moderate temperature difference

Severe temperature difference

- 1. Project Overview
- 2. Data Collection
- 3. Data Processing
- 4. Data Summary

Difference in Traffic Levels – Haul Time

US 1

US 15

Processed Data

Paver Stops	Total Number of	Number of Increments within Temp. Regimes			Thermal Streaking	
Stops	Increments	Minor	Moderate	Severe	Streaking	
US 1 Project						
Exclude	108	2	24	82	None	
Include	108	2	16	90	None	
US Route 15 Project						
Exclude	84	72	10	2	None	
Include	84	71	9	4	None	

To include or exclude paver stops? If paver stop cause severe temperature differences: they should be included. However:

Required paver stops due to sampling should be eliminated from temperature difference profiles.

Processed Data for US 15

Paver Stops	Total Number of	Number of Increments within Temp. Regimes			Thermal Streaking
	Increments	Minor	Moderate	Severe	Streaking
Exclude	84	72	10	2	None
Include	84	71	9	4	None

Minnesota DOT's specification:

- Minor Temperature Difference: +\$20 per Increment
- Moderate Temperature Difference: \$0 per Increment
- Severe Temperature Difference: -\$20 per Increment

Total Incentive to Contractor:

\$1,340 for the project segment [Including paver stops].

Processed Data for US 1

Paver Stops	Total Number of	Number of Increments within Temp. Regimes			Thermal Streaking
	Increments	Minor	Moderate	Severe	Streaking
Exclude	108	2	24	82	None
Include	108	2	16	90	None

Minnesota DOT's specification:

- Minor Temperature Difference: +\$20 per Increment
- Moderate Temperature Difference: \$0 per Increment
- Severe Temperature Difference: -\$20 per Increment

Total Disincentive (Penalty) to Contractor: \$1,760 for the project segment [Including paver stops].

In summary: infrared scanner identified areas or locations with lower temperatures.

 Implementation: Virginia DOT, Eastern Federal Lands and Contractor Points of View

Infrared Technology (IR)

Implementation: Virginia DOT, Eastern Federal Lands, and Contractor Points of View

May 17, 2016

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

Agency/Contractor Deployment

1. Agency:

- Reasons for deploying IR Technology
- Benefits Agency points of view
- Plans to implement IR Technology; short-term plans
- Schedule for deployment
- 2. Contractor:
 - Reasons for using IR Technology
 - Benefits Contractor points of view
 - Making decisions in real time to minimize penalties
 - Use of future projects

Agency/Contractor Deployment

Some Typical Questions for Deployment:

- 1. How many projects has Pave-IR Scan[™] been used on?
- 2. How many projects were for quality assurance?
- 3. What percent of profiles exhibited medium & severe temperature differences?
- 4. How easy is it to set up the project in Pave-IR ScanTM?
- 5. Any problems experienced with the equipment?
- 6. Has the Pave-IR system changed daily practice?
- 7. Has use of the Pave-IR system changed interaction between the owner & contractor?
- 8. How easy is the IR data to extract and process?
- 9. Do you review the Pave-IR reports at the end of the day?
- 10. Do you think you are getting a higher quality mat at the end of the day using the Pave-IR system?

Infrared Technology (IR)

Implementation Products and Strategies

May 17, 2016

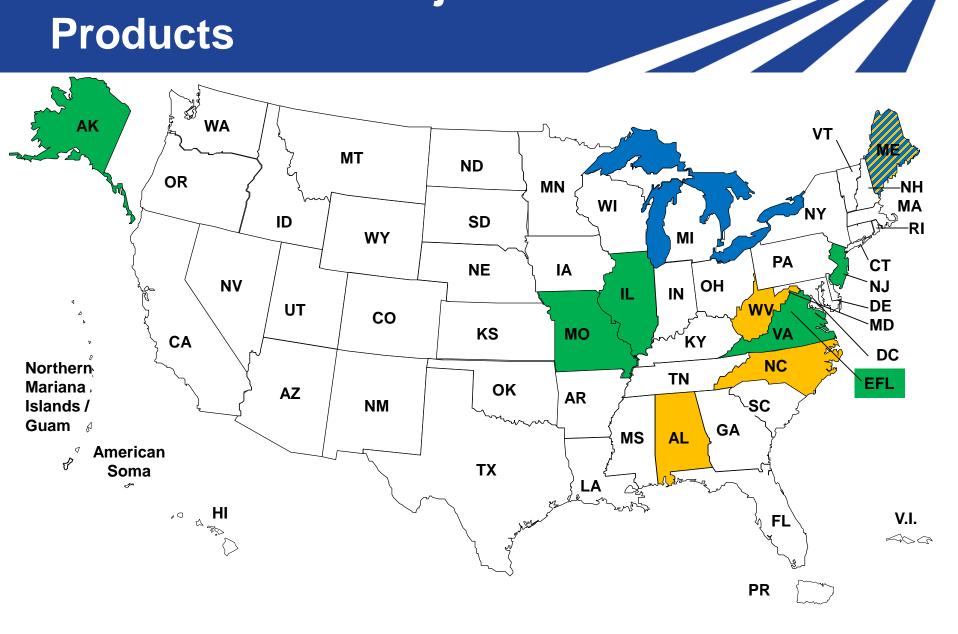

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

Implementation Products and Strategies

- 1. Field Demonstration Projects and Products
- 2. Application and Use: Examples
- 3. Questions and Answers

- 1. Case Study/Demonstration Report
- 2. Showcase
- 3. Trouble Shooting and Best Practices Guide
- 4. Specification Guide
- 5. IR Guide/Primer

- 1. Field Demonstration Projects and Case Study Report:
- Purpose/Focus
 - a) Enhance the deployment and use of the IR technology.
 - b) Identify/summarize lessons learned from field trials.
 - c) Confirm Pave-IR can identify the different types of temperature differentials that affect mat density and pavement performance.
 - d) Demonstrate and discuss value added using IR technology to agency and contractor

- 2. Showcase:
- Purpose/Focus
 - a) Highlight IR technology, provide training & operation.
 - b) Attendance includes agencies, contractors, industry, consultants and academia.
- Missouri DOT is the host agency
- Date is June 1, 2016
- Registration site link is on the showcase agenda.

All participating agencies in IR demonstration projects have received an invitation.

- 3. Trouble Shooting and Best Practices Guide
- Purpose/Focus
 - a) Provide guidance on:
 - Setting up the equipment and getting started.
 - Interpreting the raw data for making decisions.
 - b) Identify data collection and maintenance issues with the equipment and software.

4. Specification Guide; AASHTO PP 80-14

Standard Practice for

Continuous Thermal Profile of Asphalt Mixture Construction

AASHTO Designation: PP 80-141

American Association of State Highway and Transportation Officials 444 North Capitol Street N.W., Suite 249 Washington, D.C. 20001

Copylight American Association of State Highway and Transportation Officials Provided by IHS under license with AASHTO No reproduction or networking permitted without license from IHS

- 4. Specification Guide, continued
- Purpose/Focus
 - a) Advance standardization of IR equipment and testing protocols through AASHTO.
 - b) Agencies can customize it to their needs
 - c) Revised/Enhanced AASHTO PP 80-14
 - d) Agency Experience: Minnesota DOT, Texas DOT, etc.

- 5. IR Guide/Primer
- Purpose/Focus
 - a) Introduce the Pave-IR method to transportation agencies and contractors.
 - b) Increase awareness of how IR can improve paving operations and increase uniformity of mat.
 - c) Demonstrate use of Pave-IR as a QC Tool.

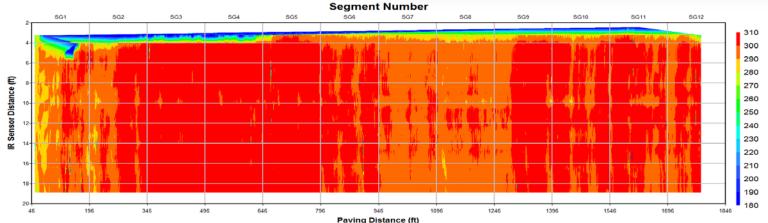

Implementation Products and Strategies

- 1. Field Demonstration Projects and Products
- 2. Application and Use: Examples
- 3. Questions and Answers

Application & Use, WHY:

- Continuous readings to evaluate mat uniformity through temperature uniformity.
- Non-uniform temperatures imply non-uniform densities, which usually mean higher maintenance.

Role of IR in Quality Assurance Programs

- 1. Quality control plan; contractor
 - Improve communication between personnel
 - Reduce risk of being penalized
 - Forensic tool to trouble shoot low or non-uniform densities
- 2. Acceptance plan; agency
 - Reduce future distress and maintenance costs
 - Dispute resolution

IR Role in Quality Control Plan; 4 examples

- 1. Missouri demonstration project
- 2. Maine demonstration project
- 3. Virginia demonstration project
- 4. Federal Lands demonstration project

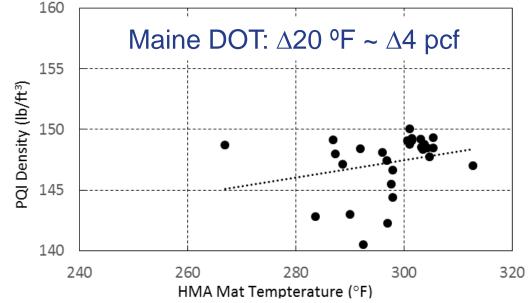

- 1. Missouri demonstration project
 - Increased communication between plant and paver to minimize temperature differentials of mat.

2. Maine demonstration project

- Monitor average temperature differential on a lot by lot basis for identifying need to take action.
- 85 percent of segments exhibited < 25 °F.
- If average temperature differential exceeds 15 °F, risk for penalty increases.

- 3. Virginia demonstration project
 - Identify reason for severe temperature differentials and take action.
 - Avg. temperature differential at start of paving project; about 30 °F.
 - Avg. temperature differential after adding two trucks; about 15 °F.

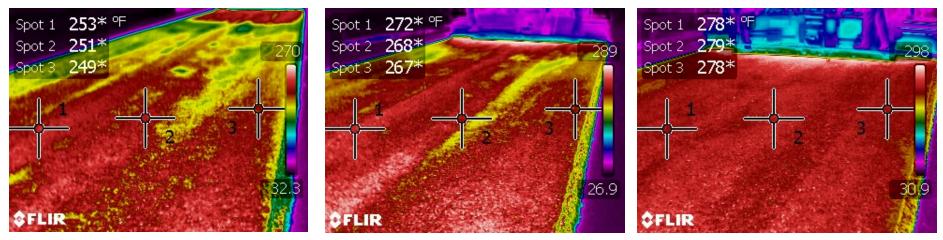

- 4. Federal Lands demonstration project
 - Identify reason for severe temperature differentials and take action; loading of trucks.
 - One dump of mix in truck bed severe temp. differential
 - Two dump, no stockpile reduced temp. differential.

IR Role in Acceptance Plan; examples:

- 1. Identify cold spots
 - Colorado, Michigan, Minnesota, Quebec, Texas, Washington
- 2. Identify thermal streaks
 - Quebec

Cold spots; areas with increased potential for:

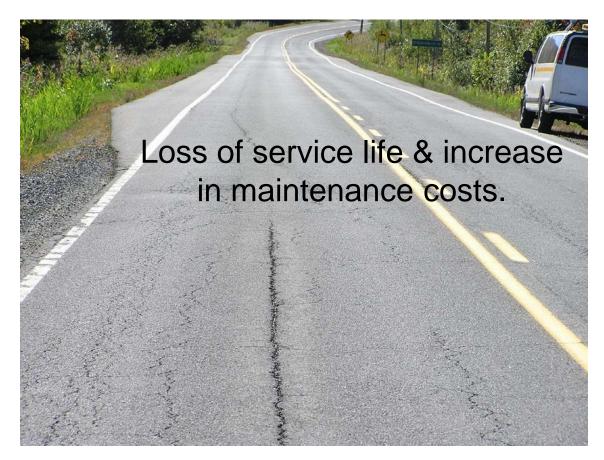

- Fatigue cracks
- Raveling
- Pot holes

Thermal streaks; areas with increased potential for longitudinal cracking.

Specification Guide; AASHTO PP 80-14

- 1. Scope
- 2. Referenced Document
- 3. Terminology
- 4. General Thermal Profile Requirements
- 5. Hardware
- 6. Data File Format
- 7. Calibration
- 8. Profiler Accuracy
- 9. References
- 10. Appendices (Non-mandatory)
 - 1. Example Acceptance Criteria
 - 2. Terminology
 - 3. Criteria
 - 4. Monetary Adjustment

Standard Practice for

Icenses-Florida Department of Transportation/59030220 Ict for Resale, 06/04/2015 13:30:32 MDT

IR Role in Acceptance Plan

- Determine biased areas for sampling and testing
 - Washington DOT
- Determine pay factors
 - Minnesota DOT
 - Quebec
- Minnesota pay factors for each 150 foot segment:
 - \$20 bonus; <25°F
 - \$20 penalty; >50°F

Washington State Department of Transportation

WSDOT SOP 733

Determination of Pavement Density Differentials Using the Nuclear Density Gauge

1. Scope

This test method describes the procedure for locating and testing areas of suspected low cyclic density. Lower pavement density has been related to temperature differentials and areas of "spots, streaks" or visual pavement irregularities. This method uses infrared detection devices and visual inspection to identify areas of potentially low cyclic density.

2. Definitions

- a. Temperature Differential Area- \underline{Anv} area where the temperature of the newly placed HMA pavement is greater than 25° F different than the surrounding area.
- b. Aggregate segregation- "Spots, streaks" or visual pavement irregularities in the newly placed HMA pavement that has a significant difference in texture when compared to the surrounding material.
- c. Systematic Density Testing the testing of temperature differential areas or areas of aggregate segregation to determine if there is a pattern of low cyclic density.

3. Equipment

- a. An approved infrared camera OR a handheld noncontact infrared thermometer (features for both should include continuous reading, minimum, maximum, and average readings, laser sighting, and a minimum distance to spot size ratio (D:S) of 30:1.
- b. Nuclear moisture-density gauge
- c. Tape measure.
- d. A can of spray paint for marking test locations.
- e. Required report form.
- 4. Testing Criteria
 - a. Where temperature differentials are 25° F or greater a systematic HMA compaction test is required.
 - b. Where temperature differentials are less than 25° F a systematic HMA compaction test is not required unless, an area shows signs of visual pavement irregularities, surface segregation or a significantly different texture.
- 5. Determination of Systematic Density Testing Locations

Use either and infrared camera or a handheld non-contact infrared device to locate temperature differential areas as follows:

WSDOT Materials Manual M 46-01.07 January 2011 Page 1 of 4

Washington State DOT; WSDOT SOP 733

- Aggregate segregation: spots and streaks defined by visual inspection
- Equipment for measuring temperature differentials:
 - Infrared camera
 - Handheld noncontact infrared device
 - IR-Bar or IR-Scanner not identified
- Temperature Differential Area: > 25°F and paver stops are included
 - Measured prior to compaction
- In temperature differential areas; systematic compaction test is required for all areas.

Alaska DOT; Special Provision draft

- IR and IC added to Glenn Hwy project
- After test strip is completed, monitor is covered for first lot, then removed for latter lots and compared to the first:

- IR-Scanner

- Temperature Differential Area: > 25°F and paver stops are included
 - Measured prior to compaction
- In temperature differential areas:
 - Perform density profiles
 - Adjust compaction and paving equipment operation to eliminate temperature differential areas.

Texas DOT; Item 341, Tex-244-F

- Equipment for measuring temperature differentials:
 - Infrared camera
 - IR-Bar or IR Scanner
- Temperature Differential Category, behind paver and paver stops are excluded:
 - < 25°F is minor thermal segregation
 - 25°F to 50°F moderate thermal segregation
 - $> 50^{\circ}$ F is severe thermal segregation
- In areas with severe temperature differential:
 - Eliminate or remove and replace.
 - Density profile not required when using IR devices

Minnesota DOT

- Equipment for measuring temperature differentials:
 IR Scanner
- Temperature Differential Category and acceptance:
 - $< 25^{\circ}F$ is minor thermal segregation;
 - 25°F to 50°F moderate thermal segregation
 - $> 50^{\circ}$ F is severe thermal segregation

\$20 bonus/sect.\$0 bonus\$20 penalty/sect.

Deployment Strategy, Common Steps/Tasks:

- 1. Define temperature differences that cause significant distress, increasing maintenance cost & reducing service life (Minnesota, Ontario, Texas, Washington).
 - a) Many published reports that document the importance of temp.
- 2. Identify mat property changes between areas with severe temperature differentials (Ontario, Texas).
 - a) Many research reports that identify how density affects the mat's properties related to performance.
- 3. Draft IR specification (Minnesota, Ontario, Texas, Washington)
- 4. Obtain comments from industry for revising specification; getting input from other partners (Ontario, Minnesota, Texas).
- 5. Host/sponsor training sessions with equipment/software

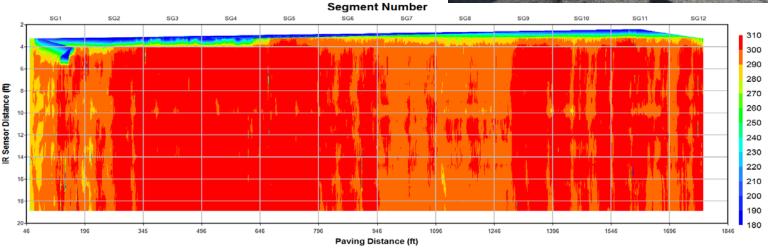

Deployment Strategy, Common Steps/Tasks:

- 6. Execute pilot projects over 1 to 2 years (Minnesota, Ontario)
- 7. Educate industry/agency personnel on results (Ontario).
- 8. Update/revise specification (Minnesota, Ontario, Texas, Washington)
- 9. Establish actions based on temperature profile differences (all)
 - a) Increased density testing (Texas)
 - b) Biased testing (Washington)
 - c) Incentives/disincentives based temperature differentials (Minnesota, Ontario)
- 10. Confirm appropriateness of acceptance plan (Ontario)
- 11. Full deployment

Conclusion from demonstration projects, to-date:

 Pave-IR scanner is one tool to confirm a uniform, highquality mat.

Implementation Products and Strategies

- 1. Field Demonstration Projects and Products
- 2. Application and Use: Examples
- 3. Questions and Answers

Agency/Contractor Deployment

Some Questions for Deployment:

- 1. How many projects has Pave-IR Scan[™] been used on?
- 2. How many projects were for quality assurance?
- 3. What percent of profiles exhibited medium & severe temperature differences?
- 4. How easy is it to set up the project in Pave-IR ScanTM?
- 5. Any problems experienced with the equipment?
- 6. Has the Pave-IR system changed daily practice?
- 7. Has use of the Pave-IR system changed interaction between the owner & contractor?
- 8. How easy is the IR data to extract and process?
- 9. Do you review the Pave-IR reports at the end of the day?
- 10. Do you think you are getting a higher quality mat at the end of the day using the Pave-IR system?
- 11. How have agencies/contractors used the IR products?

Complete workshop forms.
